Abstract.

The report illustrates the path taken as part of the planned conservation project at the Pallata Tower in Brescia. Despite the economic crisis, the City of Brescia kept up with the monument's monitoring after receiving funding from the Cariplo Foundation for activities related to the knowledge of the building's characteristics and the conservation complexities of the tower.

From 2008 to 2023, the knowledge about the monument has been enriched with much data that needs correct management in order not to cancel the collection work. In collaboration with the University of Brescia, an HBIM model is being evaluated to test paths for the management of the bulk of materials and, above all, to evaluate proposals for continuous implementation on the occasion of planned activities.
